2 Introduction

The CoMET package is a web-based plotting tool and R-based package to visualize EWAS (epigenome-wide association scan) results in a genomic region of interest. CoMET provides a plot of the EWAS association signal and visualisation of the methylation correlation between CpG sites (co-methylation). The CoMET package also provides the option to annotate the region using functional genomic information, including both user-defined features and pre-selected features based on the Encode project. The plot can be customized with different parameters, such as plot labels, colours, symbols, heatmap colour scheme, significance thresholds, and including reference CpG sites. Finally, the tool can also be applied to display the correlation patterns of other genomic data, e.g. gene expression array data.

coMET generates a multi-panel plot to visualize EWAS results, co-methylation patterns, and annotation tracks in a genomic region of interest. A coMET figure (cf. Fig. 1) includes three components:

1. the upper plot shows the strength and extent of EWAS association signal;
2. the middle panel provides customized annotation tracks;
3. the lower panel shows the correlation between selected CpG sites in the genomic region.

The structure of the plots builds on snp.plotter (Luna et al., 2007), with extensions to incorporate genomic annotation tracks and customized functions. coMET produces plots in PDF and Encapsulated Postscript (EPS) format.

3 Usage

CoMET requires the installation of R, the statistical computing software, freely available for Linux, Windows, or MacOS. CoMET can be downloaded from bioconductor. Packages can be installed using the install.packages command in R. The coMET R package includes two major functions *comet.web* and *comet*. The function *comet.web* generates output plot with the same settings of genomic annotation tracks as that of the webservice (http://comet.epigen.kcl.ac.uk:3838/coMET/ or http://www.epigen.kcl.ac.uk/comet). The function *comet* generates output plots with the customized annotation tracks defined by user.

```
source("http://bioconductor.org/biocLite.R")
biocLite("coMET")
```

CoMET can be loaded into R using this command:

```
library(coMET)
```

```
## Loading required package:  grid
## Loading required package:  biomaRt
## Loading required package:  Gviz
## Loading required package:  BiocGenerics
## Loading required package:  parallel
##
## Attaching package:  'BiocGenerics'
##
## The following objects are masked from 'package:parallel':
##
##    clusterApply, clusterApplyLB, clusterCall, clusterEvalQ, clusterExport,
```

```
##    clusterMap, parApply, parCapply, parLapply, parLapplyLB, parRapply,
##    parSapply, parSapplyLB
##
## The following object is masked from 'package:stats':
##
##    xtabs
##
## The following objects are masked from 'package:base':
##
##    anyDuplicated, append, as.data.frame, as.vector, cbind, colnames, do.call,
##    duplicated, eval, evalq, Filter, Find, get, intersect, is.unsorted, lapply,
##    Map, mapply, match, mget, order, paste, pmax, pmax.int, pmin, pmin.int,
##    Position, rank, rbind, Reduce, rep.int, rownames, sapply, setdiff, sort,
##    table, tapply, union, unique, unlist
##
## Loading required package:  rtracklayer
## Loading required package:  GenomicRanges
## Loading required package:  IRanges
## Loading required package:  GenomeInfoDb
## Warning:  replacing previous import by 'hash::keys' when loading 'coMET'
```

The configuration file specifies the options for the coMET plot. Example configuration and input files are also provided on http://www.epigen.kcl.ac.uk/comet. Information about the package can viewed from within R using this command:

```
?comet
?comet.web
```

4 Files formats

There are five types of file that user should or can give to produce the plot:

1. info file is defined in the option DATA.FILE (mandatory)
2. correlation files is defined in the option CORMATRIX.FILE (mandatory)
3. extra info files are defined in the option DATA.FILE.LARGE.
4. Annotation info file is defined in the option BIOFEAT.USER.FILE.

4.1 Format of info file (mandatory):

Info file can be a list of CpG sites with/without Beta value (or direction sign). If it is a site file then it is mandatory to have the 4 columns as shown below with headers in the same order. Beta can be the 5th column(optional) and it can be either a numeric value (positive or negative values) or only direction sign ("+", "-")

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
infofile <- file.path(extdata, "cyp1b1_infofile.txt")
```

```
data_info <-read.csv(infofile, header = TRUE,
                     sep = "\t", quote = "")

head(data_info)
```

```
##     TargetID CHR  MAPINFO      Pval
## 1 cg22248750   2 38294160 2.750e-01
## 2 cg11656478   2 38297759 7.795e-01
## 3 cg14407177   2 38298023 2.864e-01
## 4 cg02162897   2 38300537 3.148e-07
## 5 cg20408276   2 38300586 1.468e-06
## 6 cg00565882   2 38300707 7.563e-03
```

Alternatively, the info file can be region-based and if so, the region-based info file must have the 5 columns (see below) with headers in this order. The beta or direction can be included in the 6th column (optional).

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
infoexp <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")

data_infoexp <-read.csv(infoexp, header = TRUE,
                        sep = "\t", quote = "")

head(data_infoexp)
```

```
##                              TargetID CHR MAPINFO.START MAPINFO.STOP      Pval BETA
## 1 ENSG00000138061.7_38294652_38298453   2      38294652     38298453 3.064e-17    +
## 2 ENSG00000138061.7_38301489_38302532   2      38301489     38302532 1.145e-07    +
## 3 ENSG00000138061.7_38302919_38303323   2      38302919     38303323 1.014e-08    -
```

4.2 Format of correlation matrix (mandatory):

The path file of correlation matrix is described in the option CORMATRIX.FILE. This file is a tab-delimited correlation file. There are 2 different format described in the option CORMATRIX.FORMAT :

1. CORMATRIX: pre-computed correlation matrix provided by the user; Dimension of matrix : CpG_number X CpG_number
2. RAW: Raw data format. Correlations of these can be computed by one of 3 methods Spearman, Pearson, Kendall (option CORMATRIX.METHOD). Dimension of matrix : sample_size X CpG_number ;

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
corfile <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")

data_cor <-read.csv(corfile, header = TRUE,
                    sep = "\t", quote = "")
data_cor[1:6,1:6]
```

```
##   cg22248750 cg11656478 cg14407177 cg02162897 cg20408276 cg00565882
## 1  -0.086368    -0.4897     1.6719    0.52423     0.1659   0.224222
## 2  -0.001079    -0.6331     0.3151   -0.29821    -0.4339  -0.007795
```

```
## 3   0.316569    -0.2610    -0.4943    0.04657     0.1840   0.313967
## 4  -0.409150     0.6816    -0.3251   -0.58656    -0.2070   0.150720
## 5   1.299533     0.3986     0.1119    0.81182     0.1833   0.194928
## 6  -1.119488     0.3036    -1.2795   -0.49785     0.1076  -0.876012
```

4.3 Format of extra info file:

The path file of extra info files can be described in the option DATA.FILE.LARGE. Different extra info files are separated by a comma.

This can be another type of info file (e.g expression or replication data) and should follow the same rules as the standard info file.

4.4 Format of annotation file

The path of file is defined in the option BIOFEAT.USER.FILE and the format of file is the format accepted by GViz (BED, GTF, and GFF3).

4.5 Option of config.file

If you would like to make your own changes to the plot you can download the configuration file, make changes to it, and upload it into R as shown in the example below.

The important options of a coMET figure includes three components:

1. the upper plot shows the strength and extent of EWAS association signal;
   - PVAL.THRESHOLD : Threshold of the significance that is displayed as a red dash line
   - DISP.ASSOCIATION : Optional works only if MYDATA.FILE= SITE_ASSOC or REGION_ASSOC and so the file contains the effect directions. If it is FALSE (the default), the co-methylation pattern related to reference genomic reference (defined by the option MYDATA.REF) is shown in p-value plot; if it is True, the effect directions is shown on the plot
   - DISP.REGION : Optional works only if MYDATA.FILE= REGION or REGION_ASSOC. If it is TRUE, the region of genomic element will be shown by a continuous line with the color of genomic element, in addition to a symbole in center of region.
2. the middle panel provides customized annotation tracks;
   - LIST.TRACKS (for *comet.web* function): List of annotation tracks that is able to visualise visualise :geneENSEMBL, CGI, ChromHMM, DNAse, RegENSEMBL, SNP, transcriptENSEMBL, SNPstoma, SNPstru, SNPstrustoma, ISCA, COSMIC, GAD, ClinVar, GeneReviews, GWAS, ClinVarCNV, GCcontent, genesUCSC, xenogenesUCSC.
   - TRACKS.GVIZ, TRACKS.GGBIO, TRACKS.TRACKVIEWER (for *comet* function): For each option, it is possible to give a list of annotation tracks that is created by Gviz, GGBio, TrackViewer bioconductor package.
3. the lower panel shows the correlation between selected CpG sites in the genomic region.
   - CORMATRIX.FORMAT : Format of the input CORMATRIX.FILE: either raw data (option RAW) or correlation matrix (option CORMATRIX)
   - CORMATRIX.METHOD : If data are raw, it will be necessary to produce the correlation matrix being able to use 3 methods (spearman, pearson and kendall).

- CORMATRIX.COLOR.SCHEME : There are 5 colors (heat, bluewhitered, cm, topo, gray, bluetored)

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
configfile <- file.path(extdata, "config_cyp1b1_zoom_4webserver.txt")

data_config <-read.csv(configfile, quote = "")
data_config
```

```
##                                          DISP.MYDATA.TRUE
## 1                                       MYDATA.FORMAT=SITE

## 40                                        VERSION.DBSNP=snp138
```

```
## 41                      DATASET.SNP.STOMA=hsapiens_snp_som
## 42                 DATASET.REGULATION=hsapiens_feature_set
## 43                         DATASET.STRU=hsapiens_structvar
## 44               DATASET.STRU.STOMA=hsapiens_structvar_som
## 45                              PATTERN.REGULATION=GM12878
## 46                                   BROWSER.SESSION=UCSC
```

5 Creating a plot like webservice:

It is possible to reproduce the web service plotting defaults by using the function comet.web, for example the figure 1.

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")
myexpressfile <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")
configfile <- file.path(extdata, "config_cyp1b1_zoom_4webserver.txt")
comet.web(config.file=configfile, MYDATA.FILE=myinfofile,
          CORMATRIX.FILE=mycorrelation ,MYDATA.LARGE.FILE=myexpressfile,
          PRINT.IMAGE=FALSE,VERBOSE=FALSE)
```

6 Creating a plot with the generic function: comet

It is possible to create the annotation tracks by Gviz, trackviewer or ggbio, for example the figure 2. Currently, the Gviz option for annotation tracks, in combination with the heatmap of correlation values between genetics elements, provides the most informative and easy to visualize graphics.

6.1 coMET plot: pvalue plot, annotation tracks, and correlation matrice

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
configfile <- file.path(extdata, "config_cyp1b1_zoom_4comet.txt")
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")
myexpressfile <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")

chrom <- "chr2"
start <- 38290160
end <- 38303219
gen <- "hg19"
strant <- "*"

BROWSER.SESSION="UCSC"
mySession <- browserSession(BROWSER.SESSION)
genome(mySession) <- gen
```

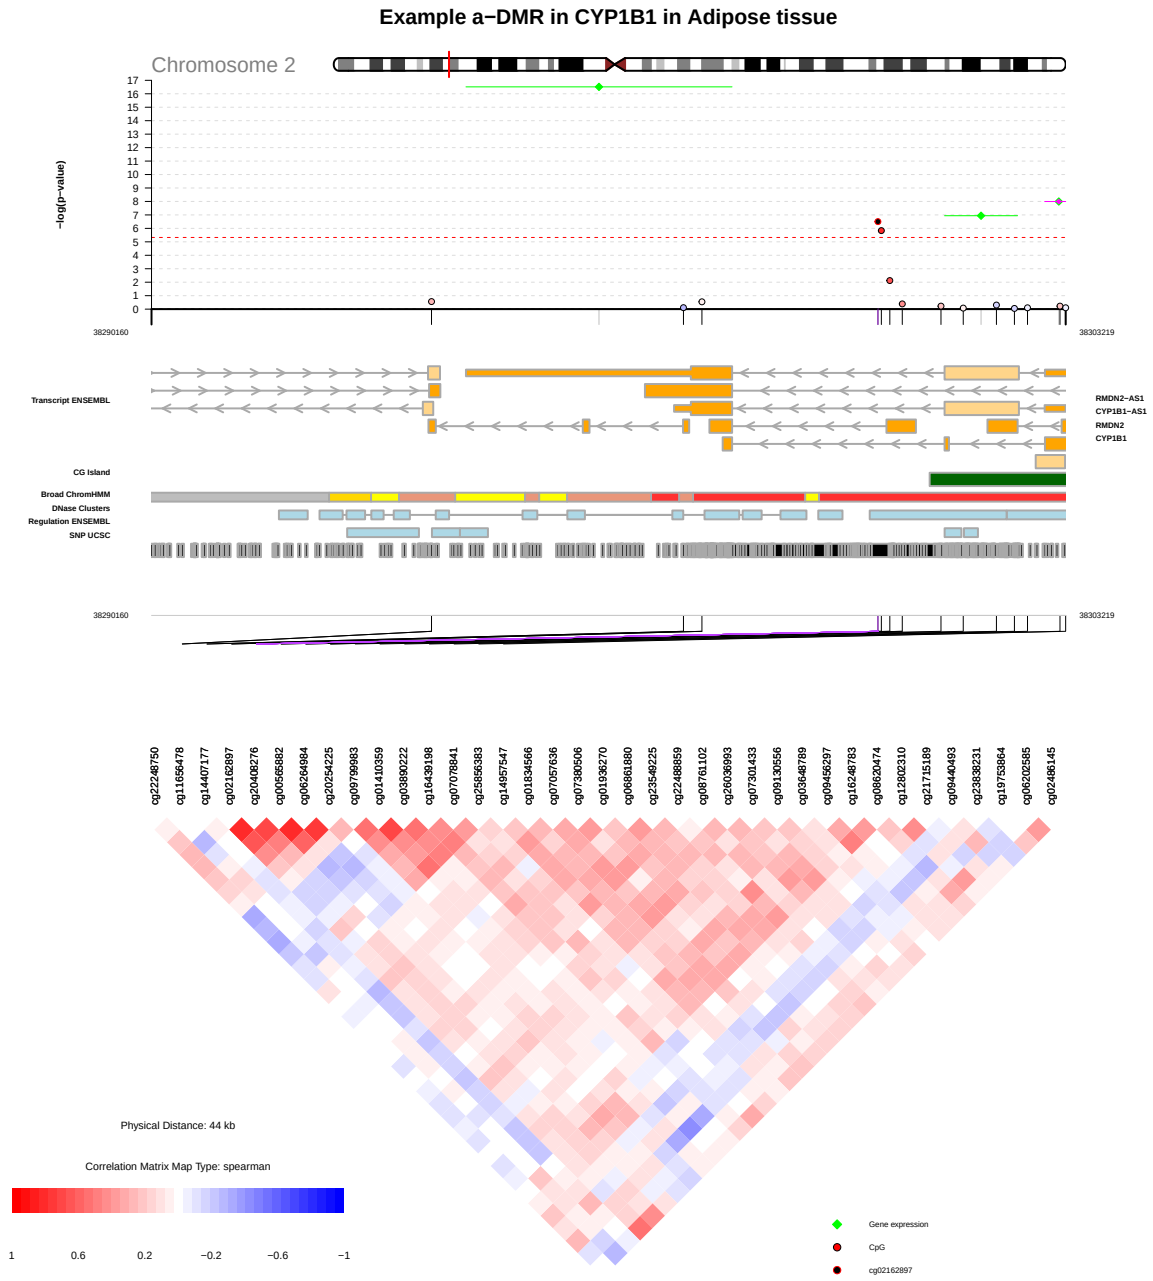

Figure 1: Plot with comet.web function.

```
genetrack <-genesENSEMBL(gen,chrom,start,end,showId=FALSE)
snptrack <- snpBiomart(chrom, start, end, dataset="hsapiens_snp_som",showId=FALSE)
strutrack <- structureBiomart(chrom, start, end, strand,
                              dataset="hsapiens_structvar_som",showId=FALSE)
iscatrack <-ISCATrack(gen,chrom,start,end,mySession, table="iscaPathogenic")

listgviz <- list(genetrack,snptrack,iscatrack)
```

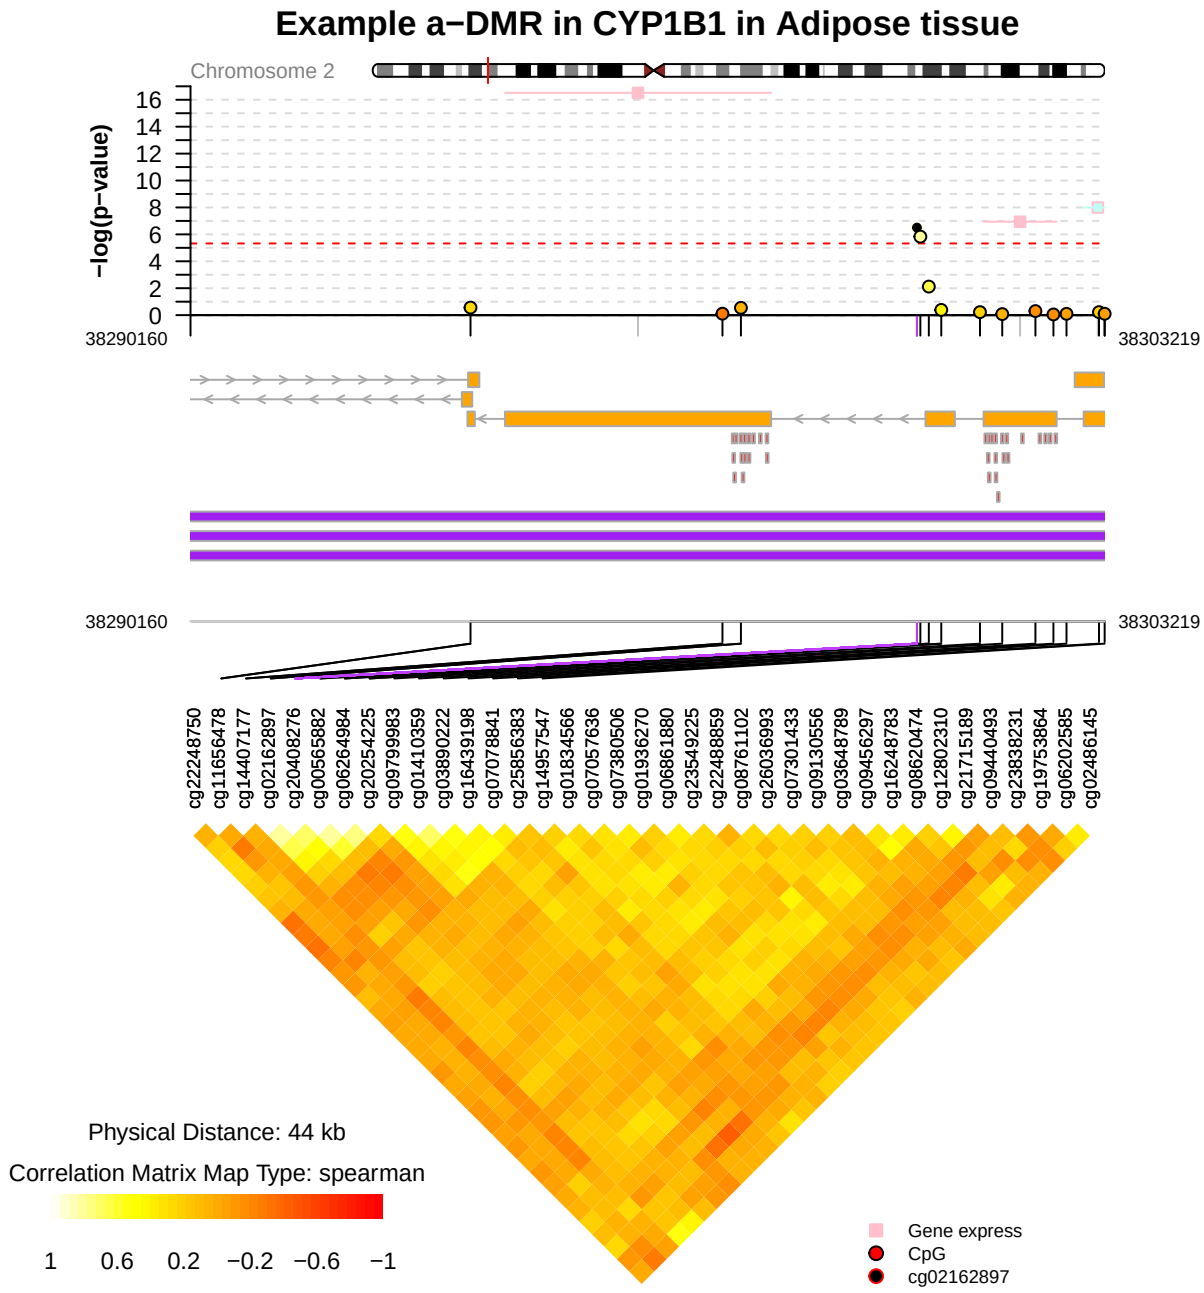

Figure 2: Plot with comet function.

```
comet(config.file=configfile, MYDATA.FILE=myinfofile, CORMATRIX.FILE=mycorrelation,
      MYDATA.LARGE.FILE=myexpressfile, TRACKS.GVIZ=listgviz,
      VERBOSE=FALSE, PRINT.IMAGE=FALSE)
```

6.2 coMET plot: annotation tracks and correlation matrice

It is possible to visualise only annotation tracks and the correlation between genetic elements. In this case, we need to use the option `DISP.PVALUEPLOT=FALSE`, for example the figure 3.

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
configfile <- file.path(extdata, "config_cyp1b1_zoom_4cometnopval.txt")
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")
#configfile <- "../inst/extdata/config_cyp1b1_zoom_4comet.txt"

chrom <- "chr2"
start <- 38290160
end <- 38303219
gen <- "hg19"

genetrack <-genesENSEMBL(gen,chrom,start,end,showId=FALSE)
snptrack <- snpBiomart(chrom, start, end,
                       dataset="hsapiens_snp_som",showId=FALSE)
strutrack <- structureBiomart(chrom, start, end,
                              strand, dataset="hsapiens_structvar_som")
clinVariant<-ClinVarMainTrack(gen,chrom,start,end)
clinCNV<-ClinVarCnvTrack(gen,chrom,start,end)
gwastrack <-GWASTrack(gen,chrom,start,end)
geneRtrack <-GeneReviewsTrack(gen,chrom,start,end)

listgviz <- list(genetrack,snptrack,strutrack,clinVariant,
                 clinCNV,gwastrack,geneRtrack)
comet(config.file=configfile, MYDATA.FILE=myinfofile, CORMATRIX.FILE=mycorrelation,
      TRACKS.GVIZ=listgviz, VERBOSE=FALSE, PRINT.IMAGE=FALSE,DISP.PVALUEPLOT=FALSE)
```

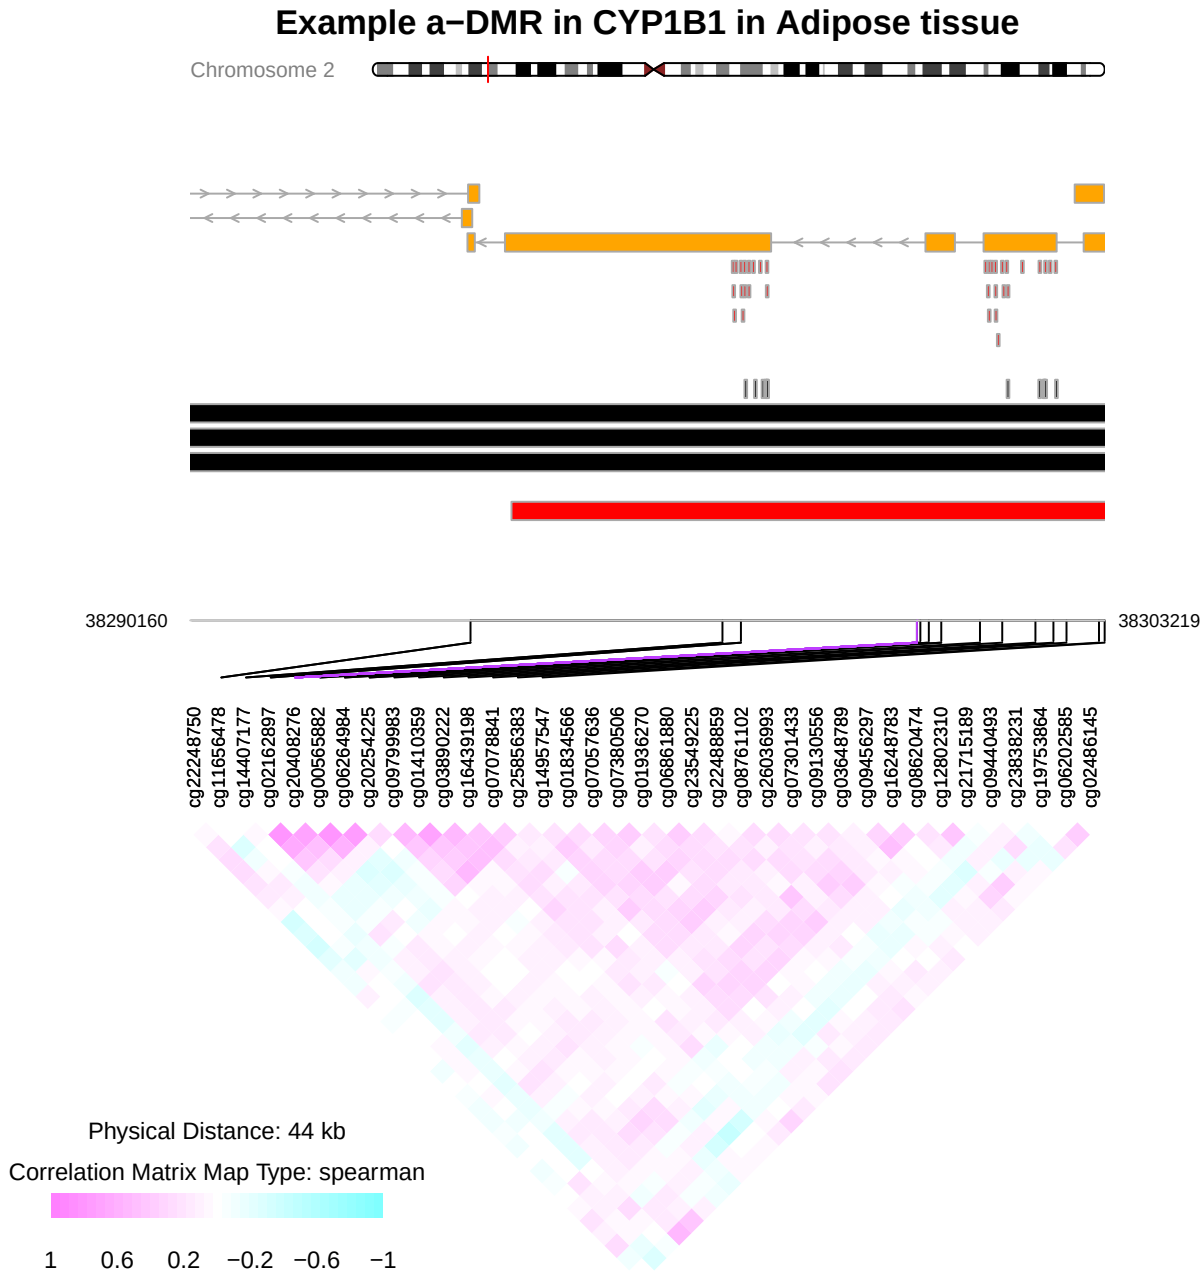

Figure 3: Plot with comet function without pvalue plot.

SessionInfo

The following is the session info that generated this vignette:

```
toLatex(sessionInfo())
