### 2 Introduction

The CoMET package is a web-based plotting tool and R-based package to visualize omic-WAS results in a genomic region of interest, such as EWAS (epigenome-wide association scan). CoMET provides a plot of the EWAS association signal and visualisation of the methylation correlation between CpG sites (co-methylation). The CoMET package also provides the option to annotate the region using functional genomic information, including both user-defined features and pre-selected features based on the Encode project. The plot can be customized with different parameters, such as plot labels, colours, symbols, heatmap colour scheme, significance thresholds, and including reference CpG sites. Finally, the tool can also be applied to display the correlation patterns of other genomic data in any species, e.g. gene expression array data.

coMET generates a multi-panel plot to visualize EWAS results, co-methylation patterns, and annotation tracks in a genomic region of interest. A coMET figure (cf. Fig. 1) includes three components:

- 1. the upper plot shows the strength and extent of EWAS association signal;
- 2. the middle panel provides customized annotation tracks;
- 3. the lower panel shows the correlation between selected CpG sites in the genomic region.

The structure of the plots builds on snp.plotter (Luna et al., 2007), with extensions to incorporate genomic annotation tracks and customized functions. coMET produces plots in PDF and Encapsulated Postscript (EPS) format.

The current version of coMET can visualise EWAS results and annotations from a genomic region up to an entire chromosome in the upper and middle panels of the coMET plot. However, the lower panel (co-methylation) is restricted to visualising a maximum of 120 single-CpG or region-based datapoints. This limitation is due to limitations in the size of a standard A4 plot, and may be updated in the near future. However, the user can use the function comet.list to extracts all significant correlations beyond a given threshold in the dataset from either a genomic region or from an entire chromosome if required.

## 3 Usage

CoMET requires the installation of R, the statistical computing software, freely available for Linux, Windows, or MacOS. CoMET can be downloaded from bioconductor. Packages can be installed using the install.packages command in R. The coMET R package includes two major functions **comet.web** and **comet** to visualise omci-WAS results.

- The function **comet.web** generates output plot with the same settings of genomic annotation tracks as that of the webservice (http://epigen.kcl.ac.uk/comet or directly http://comet.epigen.kcl.ac.uk:3838/coMET/).
- The function **comet** generates output plots with the customized annotation tracks defined by user.

```
source("http://bioconductor.org/biocLite.R")
biocLite("coMET")
```

CoMET uses the package called "psych" that is not under bioconductor. You need to install it before the installation of coMET

```
install.packages("psych")
```

coMET has a development version on gitHub, go to the section "Install the development version of coMET from Bioconductor".

You can install also on the version R 3.1 via the master version of package on gitHub. You need to do the same thing that describe in the section "Install the development version of coMET from Bioconductor"

After loading from Bioconductor or gitHUB, CoMET can be loaded into a R session using this command:

```
library("coMET")
## Loading required package:
                              qrid
## Loading required package:
                              biomaRt
## Loading required package:
                              Gviz
## Loading required package:
                              S4Vectors
## Loading required package:
                              stats4
## Loading required package:
                              BiocGenerics
## Loading required package:

      reflect
```

The configuration file specifies the options for the coMET plot. Example configuration and input files are also provided on <a href="http://epigen.kcl.ac.uk/comet">http://epigen.kcl.ac.uk/comet</a>. Information about the package can viewed from within R using this command:

```
?comet.web
?comet.list
```

### 3.1 Install the development version of coMET from Bioconductor

To install coMET from the development version of Bioconductor, the user must install R-devel from http://www.bioconductor.org/developers/how-to/useDevel/. Following this installation, use standard Bioconductor command line, e.g.

```
source("http://bioconductor.org/biocLite.R")
biocLite("coMET")
```

### 3.2 Install the version of coMET from gitHub

Another way to install coMET is to download the package from gitHUB https://github.com/TiphaineCMartin/coMET and use command line:

```
install.packages("YourPath/coMET_YourVersion.tar.gz",repos=NULL,type="source")
##This is an example
install.packages("YourPath/coMET_0.99.9.tar.gz",repos=NULL,type="source")
```

## 4 Functions in coMET

Currently, there are 3 main functions:

1. **comet.web** is the pre-customized function that allows us to visualise quickly EWAS (or other omic-WAS) results, annotation tracks, and correlations between features. This version is installed in the Shiny web-service. Currently, it is formated only to visualise human data.

- 2. **comet** is the generic function that allows us to visualise quickly EWAS results, annotation tracks, and correlations between features. Users can visualise more personalised annotation tracks and give multiple extra EWAS/omic-WAS results to plot.
- 3. **comet.list** is an additional function that allows us to extract the values of correlations, the pvalues, and estimates and confidence intervals for all datapoints that surpass a particular threshold.

The functions can read the data input files, but it is also possible to use data frames within R for all data input except for the configuration file. The latter can be achieved with the two functions **comet** and **comet.list**. The structure of the data frames (number of columns, type, format) follows the same rules as for the data input files (cf. section "File formats").

## 5 File formats

There are five types of files that the user can give to produce the plot:

1. Info file is defined in the option **mydata.file**. It is mandatory and has to be in tabular format with a header.

- 2. Correlation file is defined in the option **cormatrix.file**. It is mandatory and has to be in tabular format with a header.
- 3. Extra info files are defined in the option **mydata.file.large**. It is optional, and if provided has to be in tabular format with a header.
- 4. Annotation info file is defined in the option **biofeat.user.file**. This option exists only in the function **comet.web** and the user should inform also the format to visualise this data with the options textbf *biofeat.user.type* and textbf *biofeat.user.type.plot*.
- 5. Configuration file contains the values of these options instead of defining these by command line. Each line in the file is one option. The name of the option is in capital letters and is separated by its value by "=". If there are multiple values such as for the option list.tracks or the options for additional data, you need to separated them by a "comma".

### 5.1 Format of the info file (for option: mydata.file, mandatory)

This file is mandatory and has to be in tabular format with an header. Info file can be a list of CpG sites with/without Beta value (DNA methylation level) or direction sign. If it is a site file then it is mandatory to have the 4 columns as shown below with headers in the same order. Beta can be the 5th column(optional) and it can be either a numeric value (positive or negative values) or only direction sign ("+", "-"). The number of columns and their types are defined but the option **mydata.format**.

```
extdata <- system.file("extdata", package="coMET", mustWork=TRUE)
infofile <- file.path(extdata, "cyp1b1_infofile.txt")</pre>
data_info <-read.csv(infofile, header = TRUE,</pre>
                     sep = "\t", quote = "")
head(data_info)
##
       TargetID CHR MAPINFO
                                      Pval
## 1 cg22248750
                  2 38294160 2.749858e-01
## 2 cg11656478
                  2 38297759 7.794549e-01
## 3 cg14407177
                  2 38298023 2.863869e-01
## 4 cg02162897
                  2 38300537 3.148201e-07
## 5 cg20408276
                  2 38300586 1.467739e-06
## 6 cg00565882
                  2 38300707 7.563132e-03
```

Alternatively, the info file can be region-based and if so, the region-based info file must have the 5 columns (see below) with headers in this order. The beta or direction can be included in the 6th column (optional).

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
infoexp <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")
data_infoexp <-read.csv(infoexp, header = TRUE,</pre>
```

```
sep = "\t", quote = "")
head(data_infoexp)
##
                                 TargetID CHR MAPINFO.START MAPINFO.STOP
                                                                                  Pval BETA
## 1 ENSG00000138061.7_38294652_38298453
                                            2
                                                   38294652
                                                                 38298453 3.064357e-17
## 2 ENSG00000138061.7_38301489_38302532
                                            2
                                                   38301489
                                                                 38302532 1.145430e-07
## 3 ENSG00000138061.7_38302919_38303323
                                                   38302919
                                                                 38303323 1.014050e-08
```

In summary, there are 4 possible formats for the info file:

- 1. **site**: the file has only 4 columns with a header:
  - (a) Name of omic feature
  - (b) Name of chromosome
  - (c) Position of omic feature
  - (d) P-value of omic feature
- 2. region: the file has only 5 columns with a header:
  - (a) Name of omic feature
  - (b) Name of chromosome
  - (c) Start position of omic feature
  - (d) End position of omic feature
  - (e) P-value of omic feature
- 3. **site\_asso**: the file has only 5 columns with a header:
  - (a) Name of omic feature
  - (b) Name of chromosome
  - (c) Position of omic feature
  - (d) P-value of omic feature
  - (e) Direction of association related to this omic feature. It can be the sign or actual value of association effect size.
- 4. region\_asso: the file has only 6 columns with a header:
  - (a) Name of omic feature
  - (b) Name of chromosome
  - (c) Start position of omic feature
  - (d) End position of omic feature
  - (e) P-value of omic feature
  - (f) Direction of association related to this omic feature. It can be the sign or actual value of association effect size.

### 5.2 Format of correlation matrix (for option: cormatrix.file, mandatory)

This file is mandatory and has to be in tabular format with an header. The data file used for the correlation matrix is described in the option **cormatrix.file**. This tab-delimited file can take 3 formats described in the option **cormatrix.format**:

- 1. **cormatrix**: pre-computed correlation matrix provided by the user; Dimension of matrix : CpG\_number X CpG\_number. Need to put the CpG sites/regions in the ascending order of positions and to have a header with the name of CpG sites/regions;
- 2. raw: Raw data format. Correlations of these can be computed by one of 3 methods Spearman, Pearson,

Kendall (option **cormatrix.method**). Dimension of matrix : sample\_size X CpG\_number. Need to have a header with the name of CpG sites/regions ;

3. raw\_rev: Raw data format. Correlations of these can be computed by one of 3 methods Spearman, Pearson, Kendall (option cormatrix.method). Dimension of matrix: CpG\_number X sample\_size. Need to have the row names of CpG sites/regions and a header with the name of samples;

#### 5.3 Format of extra info file (for option: mydata.large.file)

This file is optional file and if provided has to be in tabular format with an header. The extra info files can be described in the option **mydata.large.file** and their format in **mydata.large.format**. Different extra info files are separated by a comma.

This can be another type of info file (e.g expression or replication data) and should follow the same rules as the standard info file.

## 5.4 Format of annotation file (for option biofeat.user.file)

The file is defined in the option **biofeat.user.file** and the format of file is the format accepted by GViz (BED, GTF, and GFF3).

#### 5.5 Option of config.file

Each line in the file is one option. The name of the option is in capital letters and is separated by its value by "=". If there are multiple values such as for the option **list.tracks** or options for additional data, these need to be separated them by a "comma". If you would like to make your own changes to the plot you can download the configuration file, make changes to it, and upload it into R as shown in the example below.

The important options of a coMET figure include three components:

- 1. The upper plot shows the strength and extent of EWAS association signal.
  - pval.threshold: Significance threshold to be displayed as a red dashed line

• disp.association: This logical option works only if mydata.file contains the effect direction (mydata.format=site\_asso or region\_asso). The value can be TRUE or FALSE: if FALSE (default), for each point of data in the p-value plot, the color of symbol is the color of co-methylation pattern between the point and the reference site; if TRUE, the effect direction is shown. If the association is positive, the color is the one defined with the option color.list. On the other hand, if the association is negative, the color is the opposed color.

- disp.region: This logical option works only if **mydata.file** contains regions (**mydata.format**=**region** or **region\_asso**). The value can be TRUE or FALSE (default). If TRUE, the genomic element will be shown by a continuous line with the color of the element, in addition to the symbol at the center of the region. If FALSE, only the symbol is shown.
- 2. The middle panel provides customized annotation tracks;
  - **list.tracks** (for *comet.web* function): List of annotation tracks that can be visualised: geneENSEMBL, CGI, ChromHMM, DNAse, RegENSEMBL, SNP, transcriptENSEMBL, SNPstoma, SNPstru, SNPstrustoma, ISCA, COSMIC, GAD, ClinVar, GeneReviews, GWAS, ClinVarCNV, GCcontent, genesUCSC, xenogenesUCSC. The elements are separated by a comma.
  - tracks.gviz, tracks.ggbio, tracks.trackviewer (for *comet* function): For each option, it is possible to give a list of annotation tracks that is created by the Gviz, GGBio, and TrackViewer bioconductor packages. The integration of plots from ggbio and trackviewer can be sometimes not really perfect. It is better to create plots from Gviz and use tracks.gviz
- 3. The lower panel shows the correlation between selected CpG sites in the genomic region.
  - cormatrix.format : Format of the input fie cormatrix.file: either raw data (option RAW if CpG sites are by column and samples by row or option RAW\_REV if CpG site are by row and samples by column) or correlation matrix (option CORMATRIX)
  - **cormatrix.method**: If raw data are provided it will be necessary to produce the correlation matrix using one of 3 methods (spearman, pearson and kendall).
  - cormatrix.color.scheme: There are 5 colors (heat, bluewhitered, cm, topo, gray, bluetored)

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)</pre>
configfile <- file.path(extdata, "config_cyp1b1_zoom_4webserver.txt")</pre>
data_config <-read.csv(configfile, quote = "", sep="\t", header=FALSE)
data_config
##
                                                                V1
## 1
                                                 disp.mydata=TRUE
## 2

# 6 Creating a plot like the webservice: comet.web

User can draw coMET via the coMET website (http://epigen.kcl.ac.uk/comet). It is possible to reproduce the web service plotting defaults by using the function comet.web, for example see Figure 1.

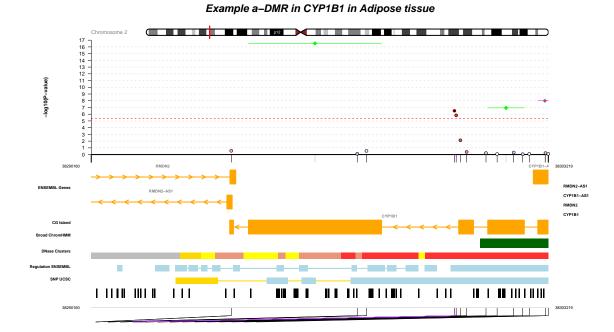

### 6.1 Hidden values of comet.web function

Hidden values of **comet.web** function are shown in the section. If these values do not correspond to what you want to visualise, you need to use the function **comet**, as a more generic option.

Option		Value	
mydata.type		FILE	
mydata.large.t	ype	LISTFILE	
cormatrix.typ	e	LISTFILE	
disp.cormatrixr	nap	TRUE	
disp.pvaluepl	ot	TRUE	
disp.mydata.na	mes	TRUE	
disp.connecting.	lines	TRUE

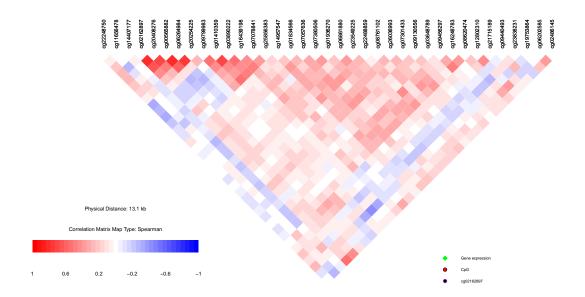

Figure 1: Plot with comet.web function.

## 7 Creating a plot with the generic function: comet

It is possible to create the annotation tracks by Gviz, trackviewer or ggbio, for example see Figure 2. Currently, the Gviz option for annotation tracks, in combination with the heatmap of correlation values between genomic elements, provides the most informative and easy approach to visualize graphics.

### 7.1 coMET plot: pvalue plot, annotation tracks, and correlation matrix

#### 7.1.1 Input from data files

In this figure 2, we create the different tracks outside to coMET with Gviz. The list of annotation tracks and different files are given to the function coMET.

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)</pre>
configfile <- file.path(extdata, "config_cyp1b1_zoom_4comet.txt")</pre>
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")</pre>
myexpressfile <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")</pre>
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")</pre>
chrom <- "chr2"
start <- 38290160
end <- 38303219
gen <- "hg19"
strand <- "*"
BROWSER.SESSION="UCSC"
mySession <- browserSession(BROWSER.SESSION)</pre>
genome(mySession) <- gen</pre>
genetrack <-genesENSEMBL(gen,chrom,start,end,showId=TRUE)</pre>
snptrack <- snpBiomart(chrom, start, end, dataset="hsapiens_snp_som",showId=FALSE)</pre>
iscatrack <-ISCATrack(gen,chrom,start,end,mySession, table="iscaPathogenic")</pre>
listgviz <- list(genetrack,snptrack,iscatrack)</pre>
comet(config.file=configfile, mydata.file=myinfofile, mydata.type="file",
      cormatrix.file=mycorrelation, cormatrix.type="listfile",
      mydata.large.file=myexpressfile, mydata.large.type="listfile",
      tracks.gviz=listgviz, verbose=FALSE, print.image=FALSE)
```

#### 7.1.2 Input from a data frame

In this figure 3, we visualize the same data as in figure 2, but they are in data frame format and not read in from an input file.

In addition, if the user would like to visualise only the correlations between CpG sites with P-value less than or equal to 0.05 in the upper plot, this option can be included. The correlations with a P-value greater than

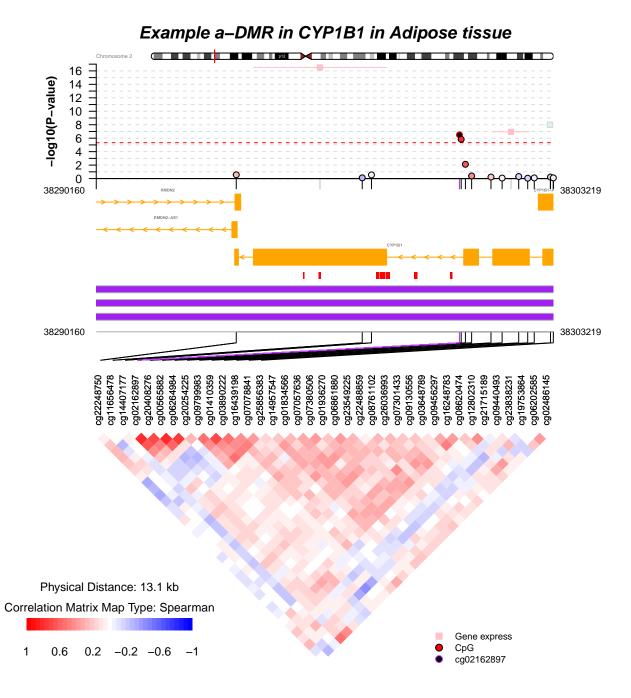

Figure 2: Plot with comet function from files.

0.05 can have a color "goshwhite" whereas the other correlations will be displayed using a color related to the correlation level. Conversely, in the P-value plot (upper plot), the points of each omic feature have their colors related to their correlations with the reference omic feature without taking into account the P-value associated with the correlation matrix.

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
configfile <- file.path(extdata, "config_cyp1b1_zoom_4comet.txt")
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")</pre>
```

```
myexpressfile <- file.path(extdata, "cyp1b1_infofile_exprGene_region.txt")</pre>
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")</pre>
chrom <- "chr2"
start <- 38290160
end <- 38303219
gen <- "hg19"
strand <- "*"
BROWSER.SESSION="UCSC"
mySession <- browserSession(BROWSER.SESSION)</pre>
genome(mySession) <- gen</pre>
genetrack <-genesENSEMBL(gen,chrom,start,end,showId=TRUE)</pre>
snptrack <- snpBiomart(chrom, start, end, dataset="hsapiens_snp_som",showId=FALSE)</pre>
iscatrack <-ISCATrack(gen,chrom,start,end,mySession, table="iscaPathogenic")</pre>
listgviz <- list(genetrack,snptrack,iscatrack)</pre>
matrix.dnamethylation <- read.delim(myinfofile, header=TRUE, sep="\t", as.is=TRUE,
                                      blank.lines.skip = TRUE, fill=TRUE)
matrix.expression <- read.delim(myexpressfile, header=TRUE, sep="\t", as.is=TRUE,
                                  blank.lines.skip = TRUE, fill=TRUE)
cormatrix.data.raw <- read.delim(mycorrelation, sep="\t", header=TRUE, as.is=TRUE,
                                   blank.lines.skip = TRUE, fill=TRUE)
listmatrix.expression <- list(matrix.expression)</pre>
listcormatrix.data.raw <- list(cormatrix.data.raw)</pre>
comet(config.file=configfile, mydata.file=matrix.dnamethylation,
      mydata.type="dataframe",cormatrix.file=listcormatrix.data.raw,
      cormatrix.type="listdataframe",cormatrix.sig.level=0.05,
      cormatrix.conf.level=0.05, cormatrix.adjust="BH",
      mydata.large.file=listmatrix.expression, mydata.large.type="listdataframe",
      tracks.gviz=listgviz,verbose=FALSE, print.image=FALSE)
```

#### 7.2 coMET plot: annotation tracks and correlation matrix

It is possible to visualise only annotation tracks and the correlation between genetic elements. In this case, we need to use the option disp.pvalueplot=FALSE, for example see Figure 4.

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)
configfile <- file.path(extdata, "config_cyp1b1_zoom_4cometnopval.txt")
myinfofile <- file.path(extdata, "cyp1b1_infofile.txt")
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")

chrom <- "chr2"
start <- 38290160</pre>
```

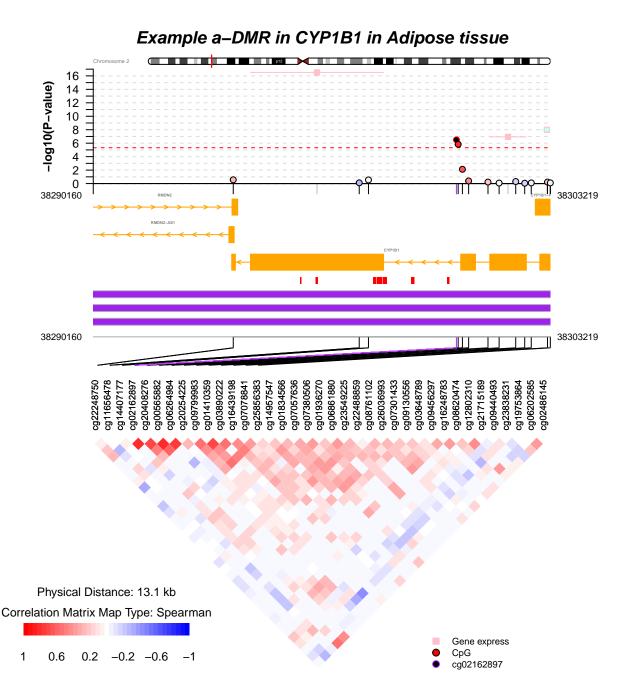

Figure 3: Plot with comet function from matrix data and with a pvalue threshold for the correlation between omics features (here CpG sites).

```
end <- 38303219
gen <- "hg19"
strand <- "*"

genetrack <-genesENSEMBL(gen,chrom,start,end,showId=FALSE)
snptrack <- snpBiomart(chrom, start, end,</pre>
```

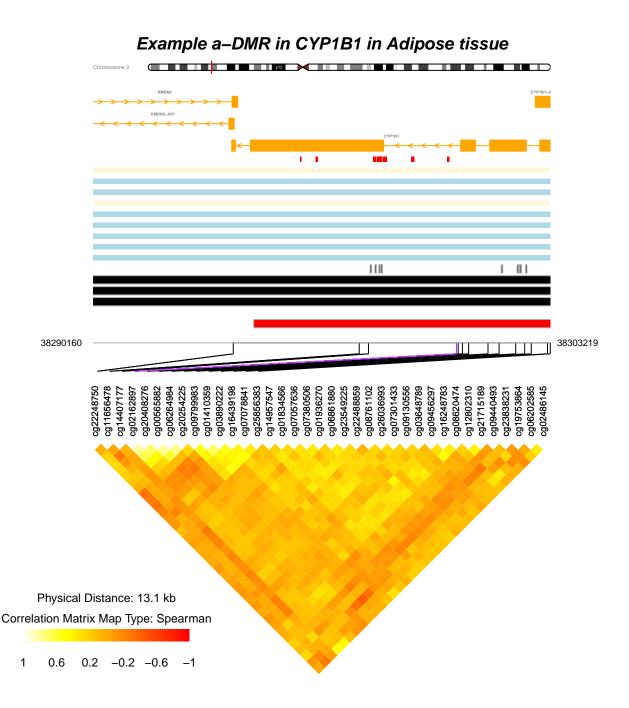

Figure 4: Plot with comet function without pvalue plot.

## 8 Extract the significant correlations between omic features

CoMET can help to visualise the correlations between omic features with EWAS results and other omic data. In addition, a function **comet.list** can extract the significant correlations according the method (**cormatrix.method**) and significance level (**cormatrix.sig.level**).

The output file has 7 columns:

- 1. the name of the first omic feature
- 2. the name of the second omic feature
- 3. the correlation between the omic features
- 4. the alpha/2 lower value (e.g. 0.05 (cormatrix.conf.level))
- 5. the alpha/2 upper value (e.g. 0.05 (cormatrix.conf.level))
- 6. the pvalue
- 7. the pvalue adjusted with the method selected (e.g. Benjamin and Hochberg) (cormatrix.adjust)

```
extdata <- system.file("extdata", package="coMET",mustWork=TRUE)</pre>
mycorrelation <- file.path(extdata, "cyp1b1_res37_rawMatrix.txt")</pre>
myoutput <- file.path(extdata, "cyp1b1_res37_cormatrix_list_BH05.txt")</pre>
comet.list(cormatrix.file=mycorrelation,cormatrix.method = "spearman",
          cormatrix.format= "raw", cormatrix.conf.level=0.05,
          cormatrix.sig.level= 0.05, cormatrix.adjust="BH",
          cormatrix.type = "listfile", cormatrix.output=myoutput,
          verbose=FALSE)
listcorr <- read.csv(myoutput, header = TRUE,</pre>
                    sep = "\t", quote = "")
dim(listcorr)

## 9 Extra information about annotation tracks

Annotation tracks can be created with Gviz using four different functions:

1. UcscTrack. Different UCSC tracks can be selected for visualisation from the table Browser of UCSC http://genome-euro.ucsc.edu/cgi-bin/hgTables?hgsid=202842745\_Dlvit14Q00G6ZPpLoEVABG8aqfrm&cl mammal&org=Human&db=hg19&hgta\_group=varRep&hgta\_track=cpgIslandExt&hgta\_table=0&hgta\_ regionType=genome&position=chr6%3A32726553\discretionary{-}{}}{}32727053&hgta\_outputType= primaryTable&hgta\_outFileName=

- 2. BiomartGeneRegionTrack. A connection should be established to the Biomart database to visualise the Genes data.
- 3. DataTrack. This should be numerical format data
- 4. AnnotationTrack. This allows visualisation of any annotation data.

To have more information, it is better to read the Gviz's vignette.

## 9.1 Genes and transcripts from ENSEMBL and UCSC

The color of the genetic elements is defined by the R package Gviz.

### 9.2 Regulatory elements from ENSEMBL

The color of regulatory elements from ENSEMBL is defined from the same criteria as ENSEMBL (in 2014). The colors and the list of features can be updated in ENSEMBL and not yet in coMET. Please to contact us if you see a difference.

Currently the colors are:

Omic Feature	Colour Name	Colour	Hex Code
Promoter Associated	darkolivegreen		#556B2F
CTCF Binding Site	cadetblue1		#98F5FF
Gene Associated	coral		#FF7256
Non-Gene Associated	darkgoldenrod1		#FFB90F
Predicted Transcribed Region	greenyellow		#ADFF2F
PolIII Transcription Associated	purple		#A020F0
Enhancer	gold		#FFD700
Transcription Factor Binding Site	darkorchid1		#BF3EFF
Predicted Weak enhancer/Cis-reg element	yellow		#FFFF00
Heterochromatin	wheat4		#8B7E66
Open Chromatin	snow3		#CDC9C9
Promoter Flank	tomato		#FF6347
Repressed/Low Activity	snow4		#8B8989
Unclassified	aquamarine		#7FFFD4

#### 9.3 ChromHMM from UCSC

The color of regulatory regions from UCSC are defined using the same criteria of UCSC in 2014. The colors and the list of features can be updated in UCSC and not yet in coMET. Please to contact us if you see a difference.

Currently the colors are :

Omic Feature	Colour Name	Colour	Hex Code
1_Active_Promoter	firebrick1		#FF3030
2_Weak_Promoter	darksalmon		#FF967A
3_Poised_Promoter	blueviolet		#8A2BE2
4_Strong_Enhancer	orange		#FFA500
5_Strong_Enhancer	coral		#FF7F50
6_Weak_Enhancer	yellow		#FFFF00
7_Weak_Enhancer	gold		#FFD700
8_Insulator	cornflowerblue		#6495ED
9_Txn_Transition	darkolivegreen		#556B2F
10_Txn_Elongation	forestgreen		#228B22
11_Weak_Txn	darkseagreen1		#8BFFC1
12_Repressed	gainsboro		#DCDCDC
13_Heterochrom/lo	gray74		#BDBDBD
14_Repetitive/CNV	gray77		#C4C4C4
15_Repetitive/CNV	gray86		#DBDBDB

#### 9.4 structureBiomart from Ensembl

These colors are for somatic structural variation and structural variation for any species.

Omic Feature	Colour Name	Colour	Hex Code
copy_number_variation	cornsilk		#FFF8DC
inversion	darkolivegreen		#556B2F
translocation	cyan		#00FFFF
sequence_alteration	coral		#FF7F50
snp	red		#FF0000
insertion	blueviolet		#8A2BE2
deletion	orange		#FFA500
indel	darkgoldenrod1		#FFB90F
substitution	dodgerblue2		#1C86EE

#### 9.5 ISCA track

International Standards of Cytogenomic Arrays Consortium defined a set of phenotypes for CNVs. Different colors are defined to represent them.

Omic Feature	Colour Name	Colour	Hex Code
iscaPathogeni	purple		#9B30FF
iscaPathGainCum	red		#FF0000
iscaPathLossCum	blue		#0000FF
iscaCuratedPathogeni	purple		#9B30FF
iscaLikelyPathogeni	orchid1		#DF78E4
iscaUncertain	lightgrey		#D3D3D3
iscaBenign	black		#000000
iscaCuratedBenign	black		#000000
iscaLikelyBenign	black		#000000

## 9.6 miRNA Target Regions from Ensemb

The colour of the miRNA target regions is defined by the R package Gviz.

## 9.7 Binding Motif Biomart from Ensembl

Listed on the next page are the different colours used for the different types of binding motifs. The frequency shown is that found in GRCh38 (hg38). Motifs with red text are found only in GRCh37 (hg19), motifs with blue text are found only in GRCh38 (hg38)

### 9.8 Other Regulatory Regions Biomart from Ensembl

Listed bellow are the different colours used for the different types of regulatory regions. The frequency shown is that found in GRCh38 (hg38).

Regions	Frequency	Colour	Hex Code
Enhancer	42926		#E41A1C
Transcription Start Site	378153		#4DAF4A

## 9.9 Regulatory Fetures Biomart from Ensembl

Listed bellow are the different colours used for the different types of regulatory etures The frequency shown is that found in GRCh38 (hg38).

Regulatory Features	Frequency	Colour	Hex code
Enhancer	26702		#E6AB02
CTCF Binding Site	24935		#66A61E
Flanking Region	17976		#E7298A
Open chromatin Promoter	15213		#7570B3
Promoter	3351		#1B9E77
TF binding site	6031		#D95F02

## 9.10 Other Regulatory Segments Biomart from Ensembl

Listed bellow are the different colours used for the different types of regulatory segments. The frequency shown is that found in GRCh38 (hg38). Segments with red text are found only in GRCh37 (hg19)

Regulatory Segments	Frequency	Colour	Hex Code
CTCF enriched	198589		#1F78B4
Predicted Enhancer	1995055		#FB9A99
Predicted heterochomatin	8188068		#CAB2D6
Predicted low activity	3469054		#FDBF6F
<b>Predicted Poised</b>	218260		#B2DF8A
Predicted Promoter Flank	839976		#33A02C
Predicted Promoter with TSS	123878		#A6CEE3
Predicted Repressed	3507490		#FF7F00
Predicted Transcribed Region	3061736		#E31A1C

## 10 coMET: Shiny web-service

#### 10.1 How to use the coMET web-service

If you want to use coMET via its webservice, please go to <a href="http://epigen.kcl.ac.uk/comet">http://epigen.kcl.ac.uk/comet</a> and select one of different instances or directly access one of the instances, for example <a href="http://comet.epigen.kcl.ac.uk">http://comet.epigen.kcl.ac.uk</a>: 3838/coMET/. We have created different instances of coMET because we did not have access to the proversion of Shiny. All instances use the same version of coMET.

If you use coMET from a Shiny webservice, you do not need to install the coMET package on your computer. The web service is user friendly and requires input files and configuration of the plot. The creation of the coMET plot can take some time because it makes a live connection to UCSC or/and ENSEMBL for the annotation tracks. First, the plot is created on the webpage, and then it can be saved as an output file. For better quality plots please use the download option and the plot will be recreated in a file in pdf or eps format.

#### 10.2 How to install the coMET web-service

These are different steps to install coMET on your Shiny web-service and you need to be root to install it.

- 1. You can install an instance of Shiny http://shiny.rstudio.com/.
- 2. You need to also install R, Bioconductor and the coMET package.
- 3. In Shiny's folder (e.g. /var/shiny-server/www), you can create a folder called "COMET".
- 4. Following this, you can install the two coMET scripts in www of the coMET package, within this new folder.
- 5. You need to change owner and permissions to access this folder. Only the user called Shiny can access it.

```
chmod 755 /var/shiny-server/www/COMET
chown shiny:shiny /var/shiny-server/www/COMET
```

- 6. You need now to update the configuration file of Shiny (e.g. /etc/shiny-server/shiny-server.conf).
- 7. You need to change owner and the permission to access this file chmod 744 /etc/shiny-server/shiny-server.conf chown shiny:shiny /etc/shiny-server/shiny-server.conf
- 8. At the end, you should restart the service Shiny via the command line: sudo restart shiny-server

Your Shiny's configuration file:

```
run_as shiny;
# Define a top-level server which will listen on a port
server {
# Instruct this server to listen on port 3838
listen 3838;
# Define the location available at the base URL
location / {
# Run this location in 'site_dir' mode, which hosts the entire directory
# tree at '/srv/shiny-server'
site_dir /var/shiny-server/www;
# Define where we should put the log files for this location
```

```
log_dir /var/shiny-server/log;

# Should we list the contents of a (non-Shiny-App) directory when the user
# visits the corresponding URL?
directory_index off;

# app_init_timeout 3600;
# app_idle_timeout 3600;
}
```

## 11 SessionInfo

The following is the session info that generated this vignette:

#### toLatex(sessionInfo())

- R version 3.2.1 (2015-06-18), x86\_64-pc-linux-gnu
